$$x_1 - \frac{1}{2}x_2 + x_3 = 2$$

**a) ¿La matriz de coeficientes tiene diagonal estrictamente dominante?**

Si, en la primera fila, segunda y tercera, la sumatoria de los elementos menos los de la diagonal es menor que los elementos de la misma diagonal.

**b) Utilice el método iterativo de Gauss-Siedel para aproximar la solución para el sistema lineal con una tolerancia de $10^{-22}$ y un máximo de 300 iteraciones.**

```
A = [
    [1, 0, -1],
    [-0.5, 0, -0.25],
    [1, -0.5, 1]
]

b = [0.2, -1.425, 2]

x = gauss_seidel(A, b, [0, 0, 0], 10e-22, 300)
print(x)
```

```
[[nan]

```

c) ¿Qué pasa en la parte b) cuando el sistema cambia por el siguiente?

$$x_1 - 2x_3 = 0.2$$

$$-\frac{1}{2}x_1 + x_2 - \frac{1}{4} = -1.425$$

$$x_1 - \frac{1}{2}x_2 + x_3 = 2$$

```
A = [

    [-0.5, 0, -0.25],

print(x)
```

## 1.7. Un cable coaxial está formado por un conductor interno de 0.1 pulgadas cuadradas y un conductor externo de 0.5 pulgada cuadradas. El potencial en un punto en la sección transversal del cable se describe mediante la ecuación de Laplac Suponga que el conductor interno se mantiene en 0 volts y el conductor externo se mantiene en 110 volts.

Aproximar el potencial entre los dos conductores requiere resolver el siguiente sistema lineal.e.
